Geological Society books refereeing procedures

The Society makes every effort to ensure that the scientific and production quality of its books matches that of its journals. Since 1997, all book proposals have been refereed by specialist reviewers as well as by the Society's Books Editorial Committee. If the referees identify weaknesses in the proposal, these must be addressed before the proposal is accepted.

Once the book is accepted, the Society Book Editors ensure that the volume editors follow strict guidelines on refereeing and quality control. We insist that individual papers can only be accepted after satisfactory review by two independent referees. The questions on the review forms are similar to those for *Journal of the Geological Society*. The referees' forms and comments must be available to the Society's Book Editors on request.

Although many of the books result from meetings, the editors are expected to commission papers that were not presented at the meeting to ensure that the book provides a balanced coverage of the subject. Being accepted for presentation at the meeting does not guarantee inclusion in the book.

More information about submitting a proposal and producing a book for the society can be found on its web site: www.geolsoc.org.uk.

It is recommended that reference to all or part of this book should be made in one of the following ways:

THE GEOLOGICAL SOCIETY

The Geological Society of London (GSL) was founded in 1807. It is the oldest national geological society in the world and the largest in Europe. It was incorporated under Royal Charter in 1825 and is Registered Charity 210161.

The Society is the UK national learned and professional society for geology with a worldwide Fellowship (FGS) of 9000. The Society has the power to confer Chartered status on suitably qualified Fellows, and about 2000 of the Fellowship carry the title (CGeol). Chartered Geologists may also obtain the equivalent European title, European Geologist (EurGeol). One fifth of the Society's fellowship resides outside the UK. To find out more about the Society, log on to www.geolsoc.org.uk.

The Geological Society Publishing House (Bath, UK) produces the Society's international journals and books, and acts as European distributor for selected publications of the American Association of Petroleum Geologists (AAPG), the American Geological Institute (AGI), the Indonesian Petroleum Association (IPA), the Geological Society of America (GSA), the Society for Sedimentary Geology (SEPM) and the Geologists' Association (GA). Joint marketing agreements ensure that GSL Fellows may purchase these societies' publications at a discount. The Society's online bookshop (accessible from www.geolsoc.org.uk) offers secure book purchasing with your credit or debit card.

To find out about joining the Society and benefiting from substantial discounts on publications of GSL and other societies worldwide, consult www.geolsoc.org.uk, or contact the Fellowship Department at: The Geological Society, Burlington House, Piccadilly, London W1J 0BG: Tel. +44 (0)20 7434 9944; Fax +44 (0)20 7439 8975; E-mail: enquiries@geolsoc.org.uk.

For information about the Society's meetings, consult *Events* on www.geolsoc.org.uk. To find out more about the Society's Corporate Affiliates Scheme, write to enquiries@geolsoc.org.uk.

Preface

As Earth's crust is the most accessible part of our planet, a wealth of information on its structure and composition is available from geological observations and geophysical measurements. Its shape and composition today are, however, the result of processes occurring at different scales in time and space, rendering study of the crust a complex and challenging undertaking. Field observations and seismic data, for example, confront us with the present day structures and must, for an in-depth understanding of their origin, be reconciled with the processes of deformation that created them. Reconstructing these processes in the past is commonly hindered by lack of continuous outcrop, limited depth resolution and little to no constraints on time. Analogue and numerical models may help improve our understanding of crustal-scale processes through their ability to simulate the birth and evolution of deformational structures at different scales. In this context, the link between theory and observations makes modelling a fundamental tool for the study of processes that alter the Earth's crust.

This volume presents new analogue and numerical model studies of natural processes contributing to the state of the Earth's crust. It shows the insights offered by models over a broad range of tectonic problems, in all cases carefully documenting the model approach used. By 'model' we mean an approximation of a physical process that will help further our understanding of the process itself, the measurable or observable structures that result from it, and the parameters that control it. Models allow us to set the boundary conditions, study the effects of parameter variations and perform sensitivity analyses. By their nature, they are, however, always a simplification of reality. As the words imply, an analogue model represents a scaled analogue of a natural structure, scaling not only the dimensions, but also the forces and material (for example, sand or clay) properties. A numerical model is a mathematical description of the natural situation, whereby aspects of processes are chosen that are of interest and can also feasibly be captured

in equations. Both modelling techniques allow us to generate hypotheses regarding crustal-scale processes that can be tested against the results of field observations and geophysical studies.

The volume is divided into five sections:

- *Analogue and numerical sandbox models* tests the reproducibility of models between different laboratories and the suitability of different numerical solution methods for reproducing sandbox results.
- *Models of orogenic processes* describes processes influencing styles of orogenic deformation at convergent plate margins.
- *Models of sedimentary basins* discusses different aspects of extension, inversion and hydrocarbon migration within extensionally-formed sedimentary basins.
- *Models of surface processes and deformation* focuses on links between crustal-scale deformation and erosion processes at the Earth's surface.
- *Models of faults and fluid flow* discusses faults, important for short-term seismicity and their long-term effects on crustal strength, and fluid flow, which is crucial for oil reservoir studies.

The origin of this volume lies in GeoMod2004, an international meeting on analogue and numerical modelling of geological processes, held in Switzerland in June 2004. We would like to thank our co-organizers, Giovanni Bertotti and Paolo Ruffo, and all the participants of GeoMod2004, who provided the stimulus for editing this volume. Sixteen of the 23 papers in this book were presented or initiated at this conference. We thank the Geological Society Publishing House and especially Angharad Hills, Staff Editor, Helen Floyd-Walker, Production Editor, and Bob Holdsworth, Society Books Editor, for all their help in the publication of this book.

Susanne Buitert
& Guido Schreurs
